Integrity Fracturing
Smarter Fluid Management

A simple, cost effective treatment during water transfer operations

By integrating treatment with water transfer, IF allows the operator to concentrate on the well and leave the *water management* to us. At IF, we believe simplicity is the key to integrating cutting edge management solutions.

Address Inefficiencies

At IF we took a close look at the inefficiencies of water transfer and used them to our advantage. By integrating treatment with water transfer operations, we reduce the number of *employees onsite*, take advantage of the downtime experienced during transfer operations, and ensure we have the industries top talent managing your water.

Innovative Technologies

By partnering with technology and chemical providers, IF concentrates on providing world class service and managing operations, while allowing the experts to concentrate on innovating new products. By utilizing technologies from other industries, we can provide a safer, robust technology previously unknown to oil and gas. IF provides oil and gas operators a simple "blend and dose" oxidation chemistry. Integrity Frac treats fresh water, brine water, and even produced water on the fly for re-use.

Safer, More Efficient Solutions

IF provides an extremely potent and efficient oxidant in a safe manner. Rather than sink capital into elaborate trailers filled with multiple flashing lights and fail safes. Integrity provides an accurate automated process at a fraction of the price. This is especially true when comparing traditional chemistries such as Chlorine Dioxide that requires various layers of fail safes and sniffers to prevent a Chlorine Gas release. The onsite generation coupled with a low energy process, allows IF to pass the savings to the customer. All while providing a more efficient and effective treatment.

Professional Water Management to ensure the Integrity of the well
